# Causes of low egg production and measure to increase egg production.

### Causes of low egg production

Failure to provide sufficient water to birds as well as abrupt changes in feeds lower egg production is it because this causes stress to birds hence less egg production. Additionally, also insufficient light as well as brooding also lower egg production. Furthermore, feather shedding causes mineral diversion for feather growth hence causing low egg production.

## Remedies

Always source feeds from reputable suppliers, and provide water to birds at all times to facilitate egg formation processes.  Additionally, also change feeds gradually to avoid stressing the birds and also provide compatible feeding supplements. Furthermore, provide light for 14-16 hours of light daily, isolate broody hens from the flock, and feed chicken extra proteins for faster egg growth hence controlling stress among layer birds.
