

Forecasting the weather with an app

For successful farming by the farmers, conditions must be favourable for crop growth in a particular season of a given year for a particular crop.

For centuries, farmers use natural indicators to decide when to plant and some of the indicators include wild plant flowers and birds making nests. These indicators determine how good the season will be to the farmers of given crops.

Season determination

First, weather is revealed the nature of the clouds and also the modern tools which farmers use like Apps and social media. Natural indicators are important to predict weather in long term while weather Apps make weather forecast everyday for week.

Similarly, data is updated constantly if you have internet connection and forecast from app is more accurate if there is a weather station near village. Cell phone App is better as it gives forecast for your place.

Download App from play store, install, open and select current location. However to understand number shared by App, touch symbol with 3 dots on upper right on phone and select mm for rains and km/hr for wind speed. Also select settings then option of units, change fahrenheit to degrees centigrade.

Finally, on screen, weather information of area for the day is displayed and also gives weather information for next 7 days.
