

How To Grow Peas and Beans

Crop management

Because peas are short term crops, they are great nitroge fixers in soils together with the beans. Additionally, bean types include french beans and runners or climbers which grow in anticlock wise.

Put bean seeds between bean plants and water after planting and to use liquid sea weed on garlic, a farmer should double or tripple the concentration of the solution. Also put potatoes in mixed sea weed solution without damaging the eyes of the potatoes before planting and finally leave it in mixture for 1/2 hour.
