

How to make and use the best natural fertilizer for any plant

Homemade organic fertilizers can be used to increase the ability of plants to make their own food by photosynthesis. Using them occasionally makes the plants appear more green and more shiny.

Homemade fertilizer

Before using the fertilizer, you need to mix it with water and the mixing proportions should be in the ratio of 1:4.

After mixing it, pour it onto the plant root zone just like any normal watering process.

To make the homemade fertilizer, you need spinach leaves because spinach is a good source of Magnesium nutrient which is an essential nutrient that helps plants make their own food by photosynthesis.

Magnesium also helps plants to build blocks of chlorophyll which makes the plant leaves appear green.

The fertilizer is made by dipping the leaves in hot water, covering them properly, and leaving them to stand for at least 12 hours. After this, filter it using a strainer, and is now ready for use.
