How to make organic Neem pesticide at home

To make an organic pesticide from neem leaves, first, you need to collect neem leaves. These can be got either from the neem tree if you have one or from the vegetable market if you have no neem tree. Remove the leaves from the branches and twigs and also cut the branches into small pieces using a plier into a cooking pan.

Other steps

The neem tree grows all over the world hence you can plant one. In humans, the neem tree is also used to cure skin diseases. It has an active ingredient that enables it to be a pesticide as well as an insecticide and also as a fungicide.

Pound raw turmeric into a paste and add to the neem leaves because turmeric is as well a pesticide and fungicide.

Add. Pour water into the neem leaves and boil at an average temperature for between 15 to 20 minutes. Add 1 liter of water per 100g of neem leaves.

After boiling, cover the mixture in a shade and keep it for 24 hours. This will make the color of the solution to change.

Sieve the mixture and use the residue part of the neem leaves to make compost. Mix water with the filtrate/ liquid in a ratio of 1:1 and put a small piece of camphor and let it dissolve for about 10 minutes. Camphor isn’t a pesticide but has a smell that helps repel pests.

Now the liquid is ready to use as an organic pesticide. This

liquid is sprayed on plants and is able to control pests such as aphids, spider
mites, white flies, and mealy bugs but the useful insects can not be damaged. Use the pesticide either in the morning or evening after
sunset.
