

How To Plant Springtime Green Leafy Veges, How To Make Slug And Snail Traps

Vegetable growing

As a farmer leaves a gap between crop varieties in the same garden, control slugs and snails using yeast trap and pot trap. For yeast trap, make a spoon full of yeast, add 1 spoon of sugar and mix with warm water to activate it while for pot trap, a farmer folds papers and put them in the pot and places th pot upside down leaving a small enstry for snalis and slugs to hide during day time as they look for where to sleep. These are removed in morning and fed to chicken or thrown away.

Similarly, add rockdust to the garden, dig a small hole and place yeast trap for slugs and snails and after, net the garden to protext it from birds. Finally for bloom beans, pinch off th top for good growth to encourage growth of new plants and new flowers.
