

How To Root And Grow Rosemary From Cuttings

Rosemary production

First, select the greenest, youngest cuttings first, cut them at required length and place them in fresh soil or use shoots of at least 6 inches long, remove half of leaves from bottom of the stem and put in water of temperature 21-32 degrees centigrade range for successful rooting and provide light.

In 15-20 days, roots start growing and after 2 weeks from the appearance of the first roots, plants are ready for planting. Pre-soak soil 1 hour in pots for easier transition of cuttings and when soil is soft, make a hole in centre and place cuttings in them. Equally, bury the stem up to bottom level of leaves for it to establish in a week to 10 days after planting. Finally, don't water for 2 weeks once soil is pre-soaked prior to planting and 2-3 weeks after planting, give a tag to rooted stem.
