How To Root And Grow Rosemary From Cuttings

Rosemary production

First, select the greenest, youngest cuttings first, cut thm at required length and place them fresh soil or use shoots os atleast 6 inches long, remove half of leaves from bottom of the stem and put in water of temperature 21-32 degrees centigrade range for successful rooting and provide light. In 15-20 days, roots start growing and afetr 2 weeks from the appearance of the first roots, plants are ready for planting. Presoak soil lhour in pots for easir transition of cuttings and when soil is soft, make a hole in centre and place cuttings in them. Equally, bury the stem up to bottom level of leaves for it to establish in a week to 10 days after plantig. Finally, don't water for 2 weeks once soil is presoaked prior to planting and 2-3 weeks after plantig, give a tag to rooted stem.
