

Plant Potatoes This Way for Huge Harvest

Potato management

First, plant potatoes at 12*16 inches apart in a mixed soil 50%, 40% compost and 10% coconut powder and add fertilizer to soil of 1 cut of chicken manure per square foot. Add sulphur to lower soil pH that is to say, 1 ounce per square foot and potatoes grow well in pH 5.5.

Similarly, add iron phosphate and mix with soil and plant potato at 8 inches deep and make holes and place potatoes with eyes facing up and cover.

Finally, water the garden after planting.
