

Seed Sowing (Focus on Tomato Seeds)

Tomato management

First, lay, use paper in the tray, put seed raising mix for tomatoes to germinate in 2 weeks and 3-4 weeks growing in trays and transplant to the main garden. Equally, Make rows in the seed trays using angleline and insert labels containing variety planted and date to which is planted.

As size of seed determines the depth to which is planted, the bigger the seed, the deeper the planting depth. Cover seeds with sieved seed raising polymix and add vermiculite to keep soil moist and water seeds after planting. Add sea weed solution to water and water the plants.

Furthermore, seeds are affected by damping off which is a fungal disease and seeds rot at the base and die.

Finally, put seed trays in place and protect it from rain to stop compaction.
