Simple steps to manage and succeed in Colour/Greenhouse Capsicum/pepper farming

After planting your greenhouse the first thing, do soil testing to ensure it’s free from pests and diseases and is nutritious, this guides you on which products to use.

Choose the best variety according to your market needs then propagate it and bring it to the greenhouse. After planting drenches your plants to prevent fungal diseases. Apply the first phosphorous fertilizer during or after planting and ensure the plants are well watered. In the vegetation stage use a nitrogenous fertilizer or a nitrogenous product using organic or inorganic product. Greenhouse plants don’t always support themselves hence Support your crop to avoid pests like caterpillars and red spider mites. During flowering apply a calcium boron zinc fertilizer, this ensures continuous flower formation and potassium-based fertilizer when the fruits start ripening
