

Using sprouted grains to promote broiler growth

Sprouted grain benefits

Sprouted grains are highly beneficial to birds because they improve digestion and absorption. Additionally they also increases nutrient utilization due to elimination of anti nutritional components. Furthermore, sprouted grains increase the growth rate of birds and also reduce inflammation hence reduced stress as well as increased body immunity.

Preparation process

Start by putting grains in a large bowl, cover with fresh water and soak overnight. Thereafter crate small holes in another chosen container to help drain water from grains. Furthermore, spread sprouted grains in container containing holes for water drainage. Lastly water grain sprouts twice a day for 6 days and feed them to chicken on 6th day.
