

Using tumeric plant to boost broiler weight and increase egg production in layers

Turmeric benefits

First, turmeric increases yolk weight for embryo development thus the formation of a healthy chick. Furthermore, turmeric helps in the formation of thick shells as well as increasing weight in chickens. It also increases feed intake thus facilitating weight gain and the production of good-quality eggs and meat. Lastly, turmeric helps to reduce cholesterol levels in the blood thereby preventing blood clots.

Preparation steps

Start by obtaining and washing turmeric very well to remove foreign materials. Cut washed turmeric into thin small pieces to facilitate a faster drying process. Thereafter dry the chopped turmeric well, and grind the dried turmeric into powder. After preparation, add 10 grams of powder for every 1kg of feed and in every liter of chicken drinking water.
