

Which nutrients to apply in Tomatoes at vegetative stages

Tomato grows in different stages in planting we usually use manure, but we can also have some soil treatments like the use of lime in order now to make sure our soil is well buffed, and we reduce the acidity of the soil.

This is done according to the advice of analysts after soil analysis. At one month old the tomatoes are at the vegetative stage and at this stage, we apply fertilizer balanced of phosphorus and nitrogen or can be high nitrogenous fertilizer for we are looking to increase the vegetation to make sure we have as many stems as possible because our main interest here is when we come when we'll be.

Supporting the crop we support as many stems as possible. this helps supply enough nutrients during flowering and fruit formation. At this stage a lot of watering is needed, especially after fertilizer application this helps increase the vegetation and stems.
